

Crop Enterprise Budget

Corn for Grain, Wheatland Area

John P. Hewlett, Farm/Ranch Management Extension Specialist
Chris Bastian, Research Associate

MP-72.4

University of Wyoming - August, 1994

This enterprise budget estimates typical costs and returns for corn for grain in the Wheatland area of Wyoming. It should be used only as a guide. The data presented are not taken from an actual farm. The major assumptions in this budget are presented below.

LAND

The budget is based on a 500-acre farm, with 62.5 acres of corn for grain grown each year. Other enterprises included on this farm are: alfalfa establishment, 17 acres; alfalfa hay, 100 acres; sugar beets, 100 acres; dry beans, 75 acres; corn for silage, 62.5 acres; and setaside program, 23 acres. The remaining 60 acres include roadways, fence lines, and farmsteads. Owned land is valued at \$750 per acre for flood-irrigated land and \$850 per acre for center pivot-irrigated land. Leased land is rented on a crop-share basis. With corn for grain, a 33 percent share of gross revenue is paid to the landowner. In turn, the landowner pays for all purchased irrigation water and 33 percent of the fertilizer, herbicide, and pesticide applied to the crop. In addition, the landowner pays \$1.50 per ton of yield for hauling the grain.

LABOR

Labor is provided by the operator and one full-time employee. All labor, including operator labor, is valued at \$5 per hour plus 7.65 percent to cover social security and federal withholding taxes. Labor charges for the owner/operator represent an opportunity cost for the time spent in this enterprise. Some part-time labor is used on the farm for labor-intensive operations such as harvest.

CAPITAL

The operator provides 50 percent of the long-term capital and 50 percent of the operating capital for this enterprise. Fifty percent of the long-term capital is borrowed at an interest rate of 9.75 percent APR (Annual Percentage Rate). Fifty percent of the operating capital is borrowed at an interest rate of 9 percent APR. The interest rates used here are for short-term planning. Real interest rates should be used for accurate long-term planning.

MACHINERY, EQUIPMENT, AND BUILDINGS

A complete list of machinery, equipment, and buildings used in this enterprise and the associated values are provided in Table 1. All resources are assumed to be half depreciated. Estimated operating and ownership costs are given in Table 3. Table 3 lists only the resources used in this enterprise. Other resources used on the farm are not included. However, the reader should note that the resources listed in Tables 1 and 3 may also be used in other enterprises on the farm.

Each irrigated acre on the farm is assumed to be irrigated by a fraction of the total irrigation system. The irrigation water provided by each irrigation system is broken down as follows: 30 percent center pivot, 25 percent concrete ditch and tubes, and 45 percent gated pipe (plastic and aluminum, 50 percent each). This method was employed because crops will normally be rotated onto all farmed land over time. Table 2 estimates the

cost per acre-inch for providing irrigation water with each irrigation system.

OPERATIONS

Operations related to production of corn for grain are listed in chronological order in the enterprise budget. The ground is prepared in early April, including fertilization. The corn is planted in early May. Irrigation is started in early July, with a total of four irrigations per growing season. A total of 32 acre-inches of water is delivered per acre of corn.

Fifty percent of the corn crop is insured against weather damage/loss. Corn for grain harvest begins in late October. The budgeted yield is 120 bushel per acre (56 lbs/bu). Some of the grain harvest is stored on the farm in owned storage bins for marketing later in the year.

ENTERPRISE BUDGET

Economic costs and returns for corn for grain production are summarized by operation in the enterprise budget. Costs are broken down by stage of production. General overhead and operator management have been calculated at 5 percent and 10 percent of all cash costs, respectively.

Costs and returns for the crop share-lease arrangement are also summarized in the budget. Costs paid in whole or in part by the landowner are listed in the landowner column. The tenant column describes the tenant's share of the appropriate cost and return items. The far right column has been provided to calculate changes from this base budget for your operation.

Government program deficiency payments have been entered as a revenue item in the corn for grain budget. This revenue cannot be expected unless the producer fully participates in the program. Full participation includes idling 15 percent of the crop acreage base. (See setaside program enterprise budget.) In turn, a program payment will be made based on a historical yield base at the current program price. This corn for grain budget assumes a 100 bushel historic yield base and a program payment of \$0.5892 per bushel.

SUMMARY

Gross income for the corn for grain enterprise is estimated at \$327.72 per acre. Total variable costs are estimated at \$287.52 per acre, with total fixed costs at \$200.67 per acre. The total of all costs for corn for grain is estimated at \$488.19 per acre, leaving a net projected return of (\$160.47) per acre. The net projected returns for the share-lease arrangement are (\$46.22) per acre for the landowner and (\$114.25) per acre for the tenant. (The returns for the landowner share at \$46.22 includes a \$1.50 per ton per ton charge for hauling the harvested corn.
