

Crop Enterprise Budget

Sugar Beets

Big Horn-Washakie County Area

John P. Hewlett, Farm/Ranch Management Extension Specialist
Dennis Kaan, Farm/Ranch Management Extension Specialist
Jim Gill, Extension Educator
Eric Morrison, Extension Educator
Big Horn and Washakie County Producers

MP-100.4

University of Wyoming - August, 1997

This enterprise budget presents estimated typical costs and returns for malting barley in the Big Horn and Washakie County area of Wyoming. Data presented are not taken from an actual farm situation. A panel of Big Horn and Washakie County producers assisted in outlining the “representative” farm situation described in the budget. Thus, the budget provides a guide to determine costs and returns for specific operations. Production practices presented in the budget are not necessarily “best” management practices. The major assumptions used in this budget are presented below.

Land

This budget is based on an 880-acre farm that produces 265 acres of malting barley grown annually. Other enterprises included on this farm are: alfalfa establishment, 35 acres; alfalfa hay, 105 acres; sugar beets, 250 acres; corn for grain, 90 acres; and corn for silage, 90 acres. The remaining 80 acres include roadways, fence lines, and farmsteads. Owned land is valued at \$1,000 per acre irrigated and wasteland is valued at \$300 per acre.

Leased land is rented on a crop-share basis. A one-third share of gross revenue is paid to the landowner. In return, the landowner pays for one-third of the fertilizer and crop insurance for the crop and one-half the chemical cost for spring weed control. The landowner is also responsible for ownership costs associated with the land, buildings, and irrigation systems, as well as all irrigation water costs.

Labor

Labor is provided by the operator and one 12-month employee and one 8-month employee. All labor, including operator labor, is valued at \$7.33 per hour plus 7.65 percent to cover social security and federal withholding taxes. Labor charges for the owner/operator represent an opportunity cost for the time spent in this enterprise. Some part-time labor may be used on the farm for labor-intensive operations such as harvest.

Capital

The operator provides 70 percent of the long-term capital and 50 percent of the operating capital for this enterprise. Thirty percent of the long-term capital is borrowed at an interest rate of 8.0 percent Annual Percentage Rate (APR). Fifty percent of the operating capital is borrowed at an interest rate of 9.0 percent APR. The interest rates used here are for short-term planning. Real interest rates (interest rates adjusted for expected inflation) should be used for accurate long-term planning.

Machinery, Equipment, and Buildings

A complete list of machinery, equipment, and buildings used in this enterprise and their associated values are provided in Table 1. All resources are assumed to be half depreciated. Estimated operating and ownership costs are given in Table 3. Tables 1 and 3 list only the resources used in this enterprise. Other resources used on the farm are not included. However, the reader should note that the resources

listed in Tables 1 and 3 also might be used in other enterprises on the farm.

Each irrigated acre on the farm is assumed to be irrigated by a fraction of the total irrigation system. Water provided by each irrigation system is broken down as follows: 25 percent concrete ditch, 37.5 percent dirt ditch, and 37.5 percent gated pipe (plastic). All irrigation water is delivered to the distribution network via a delivery system. This method was employed because crops normally will be rotated over all farmed acres eventually. Table 2 presents an estimated cost per acre-inch of providing irrigation water via each irrigation system.

Operations

Operations related to sugar beet production are listed in chronological order in the enterprise budget. After fall ground preparation, spring work begins in early April, starting with fertilizer application. The beets are planted to stand (space planted) early in April. Irrigation begins about a week later, with a total of eight irrigations per growing season. A total of 45 acre-inches of water are delivered per acre of sugar beets.

None of the beet crop in this area is routinely insured against weather damage and loss. Fifty percent of the beets are weeded two separate times by migrant laborers. Early beet harvest begins in late September with defoliation. The beets are then pulled and hauled using equipment owned by the farm. Ten percent of the beets are early harvested.

Late harvest begins around mid-October for the remaining 90 percent of the crop. The budgeted yield is 22 tons per acre at 17 percent sucrose.

Enterprise Budget

Economic costs and returns for sugar beets are summarized by operation in the enterprise budget. Costs are broken down by stage of production. General overhead and operator management have been calculated at 5 percent and 10 percent of all cash costs, respectively.

Costs and returns for the crop-share lease arrangement are also summarized in the budget. Costs paid and received by the tenant are listed in the tenant column. Items paid and received by the landowner are included in the landowner column. The far right column has been provided to calculate changes from this base budget for your operation.

Summary

Gross income for the sugar beet enterprise is estimated at \$875.38 per acre. Total variable costs are estimated at \$543.40 per acre, with total fixed costs at \$211.59 per acre. The total of all costs for sugar beets is estimated at \$754.99 per acre, leaving a net projected return of \$120.39 per acre. The net projected returns for the lease arrangement are \$8.17 per acre for the landowner and \$112.21 per acre for the tenant.
